### **NATIONAL UNIVERSITY OF SINGAPORE**

#### CS2100 – COMPUTER ORGANISATION

(Semester 2: AY2018/19)

Time Allowed: 2 Hours

### **INSTRUCTIONS TO CANDIDATES**

- 1. Please write your Student Number with <u>a pen</u> (to prevent accidental erasure) only on the **ANSWER BOOKLET**. Do not write your name.
- 2. This assessment paper consists of **SEVEN (7)** questions and comprises **EIGHTEEN (18)** printed pages.
- 3. This is a **CLOSED BOOK** assessment. One double-sided A4 reference sheet is allowed.
- 4. Calculators and computing devices such as laptops and PDAs are <u>not</u> allowed.
- 5. Answer all questions and write your answers in the **ANSWER BOOKLET** provided.
- 6. You may use pencil to write your answers.
- 7. Page 12 onwards contain the MIPS Reference Data Sheet and several blank tables for your rough works.
- 8. You are to <u>submit only the **ANSWER BOOKLET**</u> and no other document.

#### 1. **[12 marks]**

Study the following MIPS code, which has one input \$50 and two outputs \$10 and \$11.

```
addi $t0, $zero, 32
addi $t1, $zero, 32
L: beq $s0, $zero, N
andi $t2, $s0 , 0x0001
beq $t2, $zero, E
addi $t1, $t1 , -1
E: addi $t0, $t0 , -1
srl $s0, $s0 , 1
j L
```

- (a) What are the values of **\$t0** and **\$t1** at the end of the execution if the value of **\$s0** at the start is 32? [2 marks]
- (b) If the value of \$\$0 is 43 at the start of execution, what is the total number of times both beq instructions branch? That is, when both "beq \$\$0, \$zero, N" branches to N and "beq \$\$12, \$zero, E" branches to E.
  [2 marks]
- (c) Give a value of **\$50** at the start such that the values of **\$10** and **\$11** at the end of the execution are both 0. [2 marks]
- (d) What is the encoding of the only **R-format** instruction above in *hexadecimal*? [2 marks]
- (e) Write the relationship between **\$t0** and **\$s0** as well as between **\$t1** and **\$s0** in a *single* sentence each. [2 marks]
- (f) Our current MIPS instruction set does not have **load half-word** since **1hw** is a pseudo-instruction. **1hw** loads 16 bits from memory to the <u>lower half</u> of the register and sets the <u>upper half</u> of the register to all zeros. The pseudo-instruction **1hw \$t0**, **80**(**\$zero**) will be translated into actual MIPS instructions before being run. Write down the equivalent actual instructions to perform **load half-word** in the fewest number of MIPS instructions possible. [2 marks]

#### 2. [4 marks]

As the number  $-0.3_{10}$  cannot be represented precisely in binary, it also cannot be represented precisely in the IEEE 754 standard single precision floating point format. However, we can <u>approximate</u> the value by <u>truncating the bits</u> to the nearest representation.

Write the approximation of  $-0.3_{10}$  in IEEE 754 standard single precision floating point format. Give your answer in hexadecimal. [4 marks]

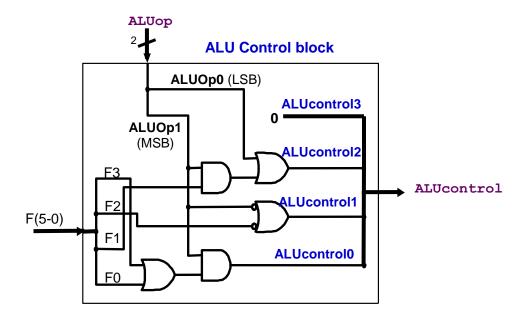

#### 3. **[14 marks]**

You are given the implementation of MIPS processor on the next page with partially incorrect modification to include the Jump instruction (j). Note that for the added multiplexer (the one with control signal **IsJump?**), if **IsJump?** is 0, the top input is chosen; otherwise the bottom input is chosen.

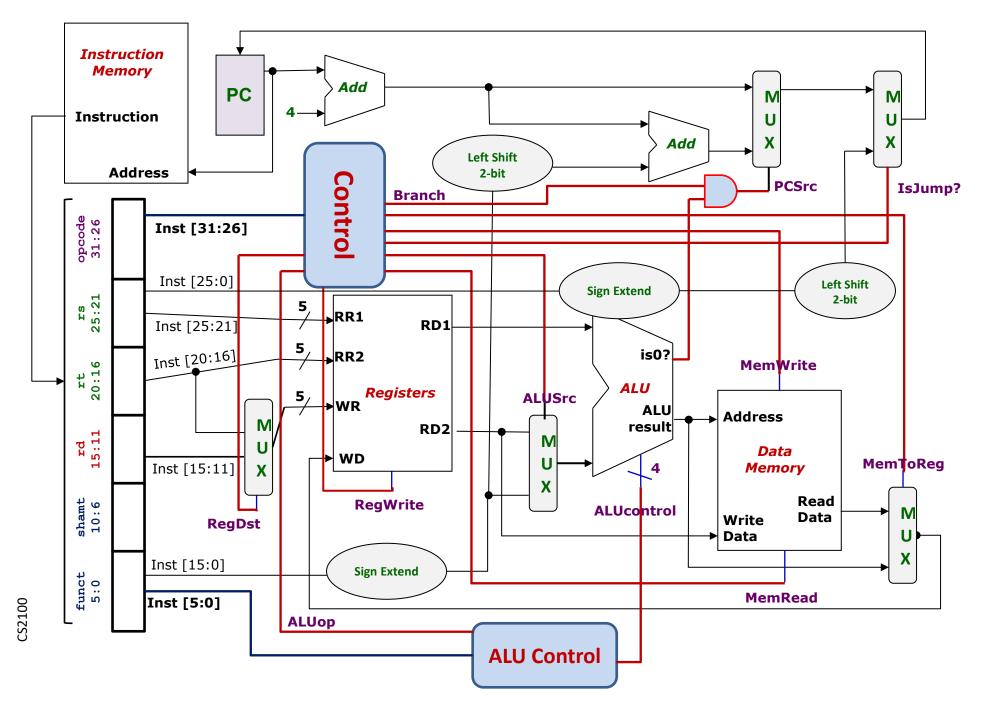

- (a) Describe what is wrong with the implementation in one sentence. [2 marks]
- (b) Consider an instruction **0x0800C840** at address **0x2100FFFC**. What is the next value of PC when the instruction is executed using the incorrect processor above?

[3 marks]

- (c) Since we are using the intermediate signal **ALUop**, we specify that the **ALUop** for j instruction is **11**. The rest of the **ALUop** does not change. Fill in the missing values in the control signal table in the answer booklet. [3 marks]
- (d) Modify the combinational circuit given in the answer booklet to include **ALUop1**, **ALUop0** and **IsJump?** control signals. [4 marks]
- (e) Given that there is no change to the ALU Control unit shown below for your convenience, what will be the value of ALUcontrol when the instruction 0x08000031 is executed? Give your answer in 4 bits binary.
  [2 marks]

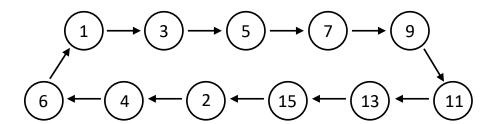

Page **3** of **18** 

#### 4. [16 marks]

A sequential circuit goes through the following states, whose state values are shown in decimal:

The states are represented by 4-bit values *ABCD*. Implement the sequential circuit using a *D* flip-flop for *A*, *T* flip-flops for *B* and *C*, and a *JK* flip-flop for *D*.

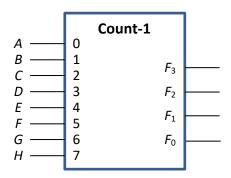

- a. Write out the **simplified SOP expressions** for all the flip-flop inputs. [10 marks]
- b. Implement your circuit according to your simplified SOP expressions obtained in part

   (a). Complete the given state diagram on the Answer Booklet, by indicating the next state for each of the five unused states.
   [5 marks]
- c. Is your circuit self-correcting? Why? (Answer without reason will not be given mark.) [1 mark]

#### 5. **[22 marks]**

For the parts below, you are to assume that <u>complemented literals are not available</u>. Note also that circuit that is correct but uses more logic gates than necessary will be given partial credit.

(a) The **8-bit count-1** device, whose block diagram is shown below, takes in an 8-bit input *ABCDEFGH* and outputs  $F_3F_2F_1F_0$  which is the number of 1s in the input. For example, if *ABCDEFGH* = 11101101, then  $F_3F_2F_1F_0$  = 0110 (six).

How would you implement an **8-bit count-0** device to count the number of 0s in the input using the above 8-bit count-1 device and XOR gates? No other gates or devices besides the count-1 device and XOR gates are allowed. [3 marks]

(b) Assuming that the 8-bit input *ABCDEFGH* is an unsigned binary number. Let P(A,B,C,D,E,F,G,H) be a Boolean function that returns 1 if *ABCDEFGH* contains an odd number of 1s and *ABCDEFGH* is an even number, or returns 0 otherwise. For example, the function *P* returns 1 for the following inputs: 01110000, 10111010, 00010000, but returns 0 for the following inputs: 00111001, 10100001, 11110000.

Implement *P* using the **Count-1 device** as shown in part (a) above, with the <u>fewest</u> <u>number of additional logic gates</u>. [3 marks]

(c) Assuming that the 8-bit input ABCDEFGH is an unsigned binary number. Let Q(A,B,C,D,E,F,G,H) be a Boolean function that returns 1 if ABCDEFGH is a multiple of 17 (eg: 0, 17, 34, 51, etc.), or returns 0 otherwise.

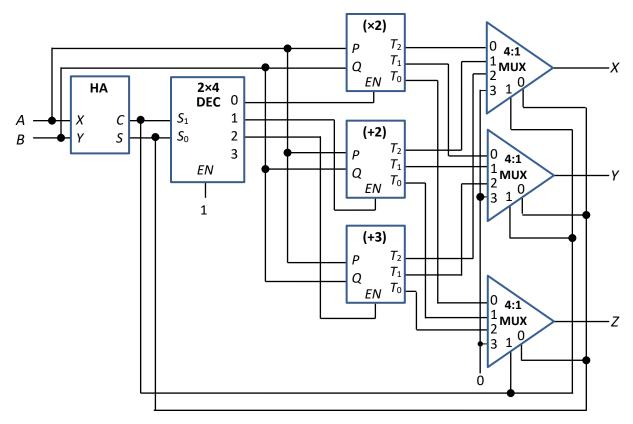

Given a **parallel adder**, a **magnitude comparator**, a **decoder**, an **encoder**, and a **demultiplexer**, implement *Q* using only <u>ONE</u> of these devices, <u>without any additional logic gates</u>. Your device should be the smallest possible (for example, if an 8-bit parallel adder is sufficient, you should not use a 16-bit parallel adder). [4 marks]

- 5. (continue...)
- (d) Implement the following four-variable function *R*(*A*,*B*,*C*,*D*) using a <u>single</u> **4:1 multiplexer** without any additional logic gates. [6 marks]

$$R(A,B,C,D) = \Sigma m(0, 2, 3, 4, 6, 7, 12, 14)$$

- (e) Study the following circuit which uses a half adder (HA), a 2×4 decoder with 1-enable and active high outputs, three 4:1 multiplexers and three devices each with a 1-enable control (EN):
  - A ( $\times$ 2)-device: it takes in two inputs P and Q and produces 3-bit output with value (P+Q) $\times$ 2.
  - A (+2)-device: it takes in two inputs P and Q and produces 3-bit output with value P+Q+2.
  - A (+3)-device: it takes in two inputs P and Q and produces 3-bit output with value P+Q+3.

For the three devices above, if a device is not enabled, its outputs are all zeroes.

Redesign the above circuit so that it can be implemented using the fewest logic gates. Write your expressions for *X*, *Y* and *Z*. You do not need to draw your circuit. [6 marks]

#### 6. [18 marks]

Given three integer arrays A, B, C, where arrays B and C each contains n elements and array A contains 2n elements, a MIPS code is written to update the elements in A with the elements in B and C as follows:

```
A[k] = A[k] + B[k/2] if k is even

A[k] = A[k] + C[(k-1)/2] if k is odd
```

For example, suppose  $A = \{1, 2, 3, 4, ...\}$ ,  $B = \{101, 102, ...\}$  and  $C = \{201, 202, ...\}$ , then the final values in A are  $\{102, 203, 105, 206, ...\}$ .

The MIPS code fragment is shown below.

```
$s0 = base address of array A
     # $s1 = base address of array B
     # $s2 = base address of array C
     \# $s3 = n, the number of elements in array B
                         # Inst1, Address: 0x00FFFF18
     add $t0, $s0, $0
                          # Inst2
     add $t1, $s1, $0
     add $t2, $s2, $0
                           # Inst3
                          # Inst4: $t3 = 2n
     add $t3, $s3, $s3
                           # Inst5: $t4 = k (loop variable)
     add $t4, $0,
                    $0
                           # Inst6: k < 2n?
Loop: slt $t5, $t4, $t3
     beq $t5, $0, End
                           # Inst7
          $t6, 0($t0)
                           # Inst8
     lw
          $t7, 0($t1)
     lw
                           # Inst9
     add $t6, $t6, $t7
                          # Inst10
          $t6, 0($t0)
                           # Inst11
     sw
          $t8, 4($t0)
                           # Inst12
     lw
          $t9, 0($t2)
                           # Inst13
     lw
     add $t8, $t8, $t9
                           # Inst14
                           # Inst15
          $t8, 4($t0)
     sw
                         # Inst16
     addi $t0, $t0, 8
                           # Inst17
     addi $t1, $t1, 4
     addi $t2, $t2, 4
                           # Inst18
     addi $t4, $t4, 2
                           # Inst19
          Loop
                            # Inst20
     j
End:
```

For parts (a), (b), (c): Given a **two-way set associative data cache** with 64 words in total, and each block containing 4 words with each word being 4 bytes long. LRU (least recently used) algorithm is used for replacement. Each integer occupies one word.

Assuming that the integer arrays B and C each contains  $\mathbf{2^{10}}$  elements. Arrays A, B and C are stored starting at memory addresses  $\underline{0 \times 00000080}$ ,  $\underline{0 \times 00100000}$  and  $\underline{0 \times 00108040}$  respectively.

The data cache is involved when memory is accessed (that is, when **Iw** and **sw** instructions are executed).

- a. How many bits are there in the set index field? In the byte offset field? [2 marks]
- b. Which set is A[0] mapped to? Which set is B[60] mapped to? Which set is C[1032] mapped to? You may write your answer in decimal or binary. [3 marks]
- c. What is the cache hit rate for array *A*? For array *B*? For array *C*? Write your answer as a fraction. [6 marks]

For parts (e), (f), (g): Given a **direct-mapped instruction cache** with 16 words in total and each block contains 4 instructions (words). The first instruction (**add** \$t0, \$s0, \$0) is at memory address 0x00FFFF18. Recall that the integer arrays B and C each contains  $2^{10}$  elements.

- d. How many misses are there in the 1<sup>st</sup> iteration (Inst1 to Inst20 inclusive)? [2 marks]
- e. How many misses are there in the 2<sup>nd</sup> iteration (Inst6 to Inst20 inclusive)? [2 marks]
- f. How many misses are there in the execution of the whole code? [3 marks]

#### 7. **[14 marks]**

Refer to the same MIPS code in the previous question:

```
$s0 = base address of array A
      # $s1 = base address of array B
      \# $s2 = base address of array C
      \# $s3 = n, the number of elements in array B
     add $t0, $s0, $0
                         # Inst1, Address: 0x00FFFF18
          $t1, $s1, $0
                            # Inst2
     add
                            # Inst3
     add $t2, $s2, $0
     add $t3, $s3, $s3
                             # Inst4: $t3 = 2n
                            # Inst5: $t4 = k (loop variable)
     add $t4, $0, $0
Loop: slt $t5, $t4, $t3
                             # Inst6: k < 2n?
     beq $t5, $0, End
                            # Inst7
          $t6, 0($t0)
                             # Inst8
     lw
          $t7, 0($t1)
                            # Inst9
     lw
     add $t6, $t6, $t7
                            # Inst10
          $t6, 0($t0)
                            # Inst11
     sw
     lw
          $t8, 4($t0)
                             # Inst12
          $t9, 0($t2)
                            # Inst13
     lw
     add $t8, $t8, $t9
                            # Inst14
     sw
          $t8, 4($t0)
                            # Inst15
     addi $t0, $t0, 8
                           # Inst16
     addi $t1, $t1, 4
                            # Inst17
     addi $t2, $t2, 4
                             # Inst18
     addi $t4, $t4, 2
                            # Inst19
          Loop
                             # Inst20
     j
End:
```

We assume a 5-stage MIPS pipeline system, and the first instruction (add \$t0, \$s0, \$0) begins at cycle 1.

- a. The jump (j) instruction causes a control hazard. What is the minimum number of stall cycles that a jump instruction would incur and how can that be achieved? [2 marks]
- b. Assuming without forwarding and branch decision is made at MEM stage (stage 4). No branch prediction is made and no delayed branching is used. How many cycles does the code from instructions 1 through 19 (leaving out the jump instruction) take? You need to count until the last stage of instruction 19. [3 marks]
- c. Assuming with forwarding and early branching, that is, the branch decision is made at ID stage (stage 2). No branch prediction is made and no delayed branching is used. How many cycles does the code from instructions 1 through 19 (leaving out the jump instruction) take? You need to count until the last stage of instruction 19. [3 marks]

- d. Assuming with forwarding and early branching, that is, the branch decision is made at ID stage (stage 2). Branch prediction is used, where the branch is predicted not taken. How many cycles does the code from instructions 1 through 19 (leaving out the jump instruction) take? You need to count until the last stage of instruction 19.

  [3 marks]
- e. Assuming <u>with forwarding</u>, how would you rearrange the instructions to reduce the number of stall cycles, and how many stall cycles is reduced as a result of this? You do not need to rewrite the full code. Just describe the changes or show the portion that is changed. Your changes should be as minimal as possible. [3 marks]
